

ABSTRACT OF THE DISCLOSURE

A mascara brush comprises a plurality of bristles. These are held by a bristle carrier comprising at least two curved core sections extending from a common handle section. In a method for manufacturing said mascara brush, the two cores are bent jointly between a bending plunger and a counter-plunger of a bending tool. Said mascara brush can be used with a mascara reservoir having a circular mascara wiping aperture. The result is a mascara brush allowing a good predetermination of the amount of mascara to be applied. Further, an improved combing result and a curl effect can be achieved.
